

Excel Guide 1

1. Using a suitable software package, load the file Supp.CSV and save it as Supplements followed by your candidate number, make sure it is saved using appropriate format.
2. Place your Centre number, candidate number and name in the header.
3. Insert a row before the first row [1]
4. Insert the text **High Quality Supplements** in the first row [1]
5. Format the text to be centered across the columns A to H [1]
6. Format the text to be 24 points, serif and bold [1]
7. Enter the following data into the Rate column [1]

Code	Rate
D	1.21
N	1.3
P	1.65

8. Name the cell containing 1.21 Discount [1]
 Name the cell containing 1.3 Normal
 Take a screenshot that shows the named cells
9. Format these three named cells as numbers to 2 decimal places. [1]
10. Format cells A3, A4 and A5 so that they are right aligned. [1]
11. Set the page orientation to landscape. [1]
12. In the Retail column (Cell G25) multiply the Unit Purchase by the Pack Size [1]
13. Replicate this formula so that the Retail price for each item is shown. [1]
14. Format all cells in row 24 to be center aligned. [1]
15. Format all cells in row 24 so that they are bold. [1]
16. Format all cells in row 24 so that they are italic. [1]
17. Format the data in the Unit Purchase and Retail columns to Euros (€) with 2 decimal places. [1]
18. Format only the Pack Size column to 1 decimal place. [1]
19. Centre align the Supplier and Code columns from row 25 to row 117 inclusive. [1]
20. In cell E119, use a function to count the number of units purchased [2]

21. In cell E120, use a function to find the total of units purchased [2]
22. In cell E121, use a function to find the max of units purchased [2]
23. In cell E 122, use a function to find the min unit purchased [2]
24. In cell E 123, use a function to find the range of unit purchased by subtracting the min from max [2]
25. In cell E 124, use a formula to find the average unit purchased [2]
26. In cell E125, use a function to count the number of times where code was 'D' [2]
27. In cell E126, use a function to calculate the total unit purchase where the code was 'D' [2]
28. In the Unit Retail column (Cell H25), use an IF function to calculate the retail price of each unit.

If the Code is D then multiply the named cell Discount by the Unit Purchase price. [8]

If the Code is N then multiply the named cell Normal by the Unit Purchase price.

If the Code is P then multiply cell B5 by the Unit Purchase price.

If the Code is not D, N or P then return the Unit Purchase price.

Replicate this function so that the Unit Retail price for each item is shown, absolute and relative referencing must be applied.
29. Hide rows from 1 to 23
30. Print the sheet showing the functions and formulae used [4]

Make sure that all contents are visible and landscape

Make sure all gridlines, column and row headings are visible

Make sure that all columns appear on one page

Make sure that all your pages contain your name, centre number and candidate number
31. Unhide rows from 1 to 23
32. Print the sheet showing the values [2]

Make sure that the row and column headings are not visible.

Make sure that all columns appear on one page

Make sure that your name, Centre number and candidate number are printed in the header.
33. Select the data where unit purchase was greater than 0.5 and Code is 'D' or 'P' [2]
34. Hide rows from 119 to 126 and print this selection [1]
35. Unhide all rows and print D119 to E126 [1]
