

Excel Guide 3

Task 1 – Evidence

1. Create an evidence document called EVIDENCE followed by your candidate number.
 - Make sure that your name, Centre number and candidate number will appear on every page of your Evidence Document by placing these details in the header of the document.

Task 2 – Spreadsheet

You work for a company called RockICT. You are going to manipulate a spreadsheet about the performance of athletes in the Shot Putt as they prepare for the 2012 Olympic games.

- 1 Using a suitable software package, load the file J1GAMES.CSV
- 2 Place your name, candidate number and Centre number in the header.
Place the automated file name and file path in the footer.
Save the file as ATHLETES followed by your candidate number; make sure it is saved using appropriate format.
- 3 In cell A3 use a lookup function to show the country name in full. Use the *Code* column for the lookup value and the file J1COUNTRY.CSV for the array. This function must include both absolute and relative referencing and must not use a named range.
Replicate this function so that the country name is shown in full for each athlete.
- 4 In cell K3 use a function to select and display the longest of the 6 throws made by the athlete.
Replicate this function so that the best throw is shown for each athlete.

Because athletes sometimes miss a throw or throw outside the area, this is recorded in the spreadsheet as a no throw using the letters NT.

- 5 In cell L3 use a function to add the distances of all the throws for this athlete. Ensure that the function does not include the distance if it is recorded as NT (a no throw).
Replicate this function so that the total distance thrown is shown for each athlete.
- 6 In cell M3 use a function to count the number of throws that were NOT recorded as NT.
Replicate this function so that the number of throws that were NOT recorded as NT is shown for each athlete.
- 7 In cell E77, use a function to count the number of throws that were recorded as NT for each throw.
Replicate the function so that the number of throws that were recorded as NT show for each throw by athletes.

- 8 In cell N3 calculate the average throw length for only the throws where a distance was recorded. Use the contents of cells L3 and M3 to help you.
Round this value to 1 decimal place.
Replicate this function so that the average throw length is shown for each athlete.
- 9 In cell O3 use a function to display the word **Yes** if the athlete's longest throw is greater than 19 and displays **No** otherwise.
Replicate this formula so that this is automatically displayed for each athlete.
- 10 Left align all cells in columns D to O inclusive.
- 11 Set the page orientation to landscape.
- 12 Hide columns B to J.
- 13 Print the spreadsheet showing the formulae used. Make sure that the contents of all these cells are visible and that the printout fits on two pages. Make sure that the gridlines, row and column headings are visible when printed.
Make sure that your name, Centre number and candidate number are printed in the header of the page.
- 14 Make all data in columns A to O fully visible.
- 15 Select only the athletes where the *Country* is Great Britain.
Use the athletes' names and the average distance that each of these athletes throws the shot to create a vertical bar chart.
- 16 Label this chart with the title Average distance for British athletes
- 17 Make sure that category axis labels show the names of the athletes and these are fully visible.
- 18 Print this chart.
Make sure that your name, centre number and candidate number are printed with this chart.
- 19 Display all data and hide columns L and M.
- 20 Hide row 77
- 21 Format only the cells in rows 1 and 2 so that they are bold, italic and centre aligned.
- 22 Display and print the records of athletes who have longest throw greater than 19.
- 23 Display all data, rows and columns
- 24 Sort this data into descending order of *Gender*, then into descending order on the *Best throw* column, showing the values and labels in full.
- 25 Use conditional formatting to display the cells in the record column as green fill with white text if they contain **Yes**.
- 26 Use conditional formatting to display the cells in the record column as red fill with black text if they contain **No**.
- 27 Take a screenshot to show how you created the conditional formatting.

28 Print this data showing the values.

Make sure that all columns are displayed in each page of your printout.

Make sure that your name, Centre number and candidate number are printed in the header of the page.

Task 3 – Submitting

1. Save and print your evidence document
2. Create a new folder in your work area
3. Rename the folder with your name
4. Add all your printouts to the folder
5. Compress the folder 6. Submit your zipped folder through our website
